DAX Email Archive

Challenge

Email has become an essential part of the primary business process in every organization. This has turned email into a mission-critical tool for many companies.
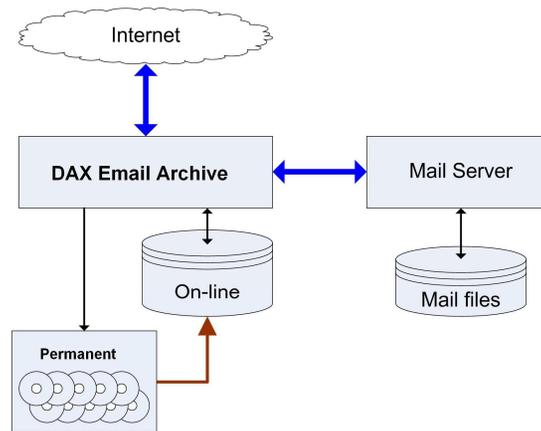

Yet, at this moment very few companies are in full control of their email system. In most cases, vital business information is not centrally managed, but only available in individual mail-files of users.

Most large organizations are able to invest in centrally managed solutions for email archiving. Elevated costs are shared by a very large group of users, rationalizing these investments on a corporate level.

Small and medium sized enterprises face essentially the same problems, but are unable to make these costly, necessary investments.

The DAX Email Archive migrates emails automatically from the users' mailbox (on the server) to the Email Archive. This offloads the server, allowing it to respond quickly without the need for continuous upgrades.

Solution

The user interface remains the same whether it is an Outlook or Notes client. Email migration is rule based permitting complete automation without user interference; users don't have to do anything.

It also utilizes "single instance store", storing file(s) that have been sent to several users (e.g. a presentation), only once. This permits both central access to the file and again offloading of storage requirements as it only has to be saved once.

Complete legal compliance is possible through WORM and pre-delivery archiving (archiving an email before it has been sent). Emails are stored permanently on DVD, Blu-ray Disc or Digital Tape while an internal hard disk cache provides instant and easy access to the most recently archived and retrieved emails.

The modular architecture of the DAX Email Archive enables a tailor-made solution, offering exactly the functionality that is required.

Benefits

- Complete archival solution, without needing to interrupt or modify existing e-mail server or clients.
- Complies with recent legislation.
- Reduces load of mail servers.
- Fast and simple implementation.
- No need to train users.
- For small, to medium and enterprise organizations.

The Email Archive Solution can be extended with other e-mail management functions such as virus and spam filtering, encryption (both OpenPGP as S/MIME) and the centralized addition of disclaimers.

Available for Microsoft Exchange and IBM Lotus Domino.
